```

Cammue BPA, Osborn RW, Rees SB, Terras FRG; Broekaert WF, ( Vanderleyden J;

WPI; 1993-100978/12.

Biocidal proteins isolated from seeds of plants - e.g. brassica or dahlia, useful for increasing plants' resistance to fungal and bacterial diseases.

Example 21; Fig 35; 110pp; English.

This cDNA represents the sequence of Rs-AFP2 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA library. This primer corresponds to amino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and closxigenin-11-dUTP instead of further reamplified with the same primers and product. This was used to screen a lambda ZAPII cDNA library by in situ plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage R408.Inserts from 2 positive clones were excised by Bcorl digstion and insert sizes of approx. 400bp the others between 250-300bp. The inserts of the 4 largest clones were then sequenced and found to differ only in the length of their s' and 3' UTR's. The longest sequence was identified as Rs-AFPI so their S' and 3' UTR's. The longest sequence was identified as Rs-AFPI so the Rs-AFPI cDNA was transformed to the Rs-AFPI concepting sequence by PCR assisted site directed mutagenesis. (Updated on 25-MAR-2003 to correct PN field.)

Sequence 261 BP; 67 A; 55 C; 59 G; 80 T; 0 U; 0 Other;

Raphanus sativus.

```
Plant-derived antimicrobial proteins are expressed in endosymbiotic Clavibacter xyli subsp. cynodontis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFP1 from R. sativus. The full-length cDNA sequence of PCR assisted site-directed mutagenesis of Rs-AFP2 is given in AAQ70130 and the deduced amino acid sequence in AAR57327. (Updated on 25-

                  Isolated DNA from Raphanus sativus used to transform a microbe and a plant to produce an antibacterial protein used to increase resistance of rice paddy against pathogenic microbes.
                                                                                                       The present sequence encodes an antibacterial protein, designated radishin, isolated from Raphanus sativus (radish). A phage or plasmid comprising radishin can be used for increasing resistance of paddy and rice blast disease against pathogenic microbes

                                                                                                                                                                                                                 This sequence is the product of the amplification of the 5' region of the antifungal polypeptide AlyAFP, isolated from plants of the genus Alyssum, by a 5' RACE (Rapid Amplification of cDNA Ends) using primers AAT94575-T94576). The AlyAFP polypeptide can be used to control phytopathogenic fungi, whilst the coding DNA can be used to produce transgenic plants that express the polypeptide making them resistant to the phytopathogenic

The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein (AMPP) I and the antifungal protein (AMPP). Inked by a linker propeptide of the invention. The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is postranslationally processed into the component protein molecules. The propeptide sequence is rich in anaho acids A, V, S and T and contains dipeptidic sequences consisting of either two acidic, two basic or one codic and one basic residue as a cleavable linker sequence
                                                                                                                        Improving expression of polyproteins in plants involves coexpression of two or more proteins in plants within a single transcription unit.

```
The present sequence corresponds to the region between XhoI and SacI sites of plant transformation vector pFAJ3106, which encompass the coding region for Dahlia merckii antimicrobial protein, Dm-AMPI. The vector is useful in the production of transgenic plants which show improved resistance to infections by microorganisms such as bacteria and fundi. Transgenic plants include e.g. field crops, fruits and vegetables, such as canola, sunflower, tomato, apple, banana, pear and mango
                                                                                                                                                                                                                       Polynucleotide sequences and expression products useful for producing transgenic plants that are resistant to microbial infections.

The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein (AMP) I and the antifungal protein 2 (APP2), linked by a linker propertied of the invention. The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is post-translationally processed into the component protein molecules. The propeptide sequence is rich in amino acids A, V, S and T and contains dipeptidic sequences consisting of either two acidic, two basic or one acidic and one basic residue as a cleavable linker sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 LysLeuCysGluArgSerSerGlyThrTrpSerGlyValCysGlyAsnAsnAsnAlaCys 20

The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein (AMP) 1 and the antifungal protein 2 (AFP), linked by a linker propertide of the invention. The specification describes methods for the invention. The specification describes methods for expense the reading operably linked to two or more proteins in a transgenic plant. The method comprises inscrting a DNA sequence having a promoter egglon operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is posttranslationally processed into the component protein molecules. The propeptide sequence is rich in amino acids A, V, S and T and contains dispeptide; sequences consisting of either two addict, two basic or one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                432

Improving expression of polyproteins in plants involves coexpression of two or more proteins in plants within a single transcription unit.

Example 2; Fig 11; 151pp; English

The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein (AMP) 1 and the antifungal protein 2 (APP2), linked by a linker properied of the invention. The specification describes methods for improperied of the invention. The specification describes methods for plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is posttranslationally processed into the component protein molecules. The propeptide sequence is rich in amino acide A, V, S and T and contains dipeptidic sequences consisting of either two acidic, two basic or one acidic and one basic residue as a cleavable linker sequence

A disease-resistant plant in which wasabi gamma-thionin gene is introduced, creation of the disease-resistant plant.

Claim 3; Page 8; 11pp; Japanese.

The present invention describes a disease-resistant plant in which a wasabi gamma-thionin gene is introduced. Also described is a method for the creation of the above disease-resistant plant by introducing a wasabi gamma-thionin gene to a plant. The present sequence encodes a Butrema wasabi (Wasabia japonica) gamma-thionin protein from the present invention

This cDNA represents the sequence of Rs-AFP1 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for. screening a Raphanus sativus seed cDNA library. This primer corresponds to amino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and digoxigenin-11-dUTP instead of dTTP to give a digoxigenin labeled PCR product. This was used to screen a lambda ZAPII cDNA library by in situ plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present DNA sequence encodes a Brassica defensin protein of the invention.

R408.Inserts from 22 positive clones were excised by EcoRI digestion and their size compared by agarose gel electrophoresis. Four clones had insert sizes of approx. 400bp the others between 250-300bp. The inserts of the 4 largest clones were hen sequenced and found to differ only in the length of their 5' and 3' UTR's. The longest sequence is given here. (Updated on 25-MAR-2003 to correct PN field.) 8888888888

WPI; 1994-249223/30. P-PSDB; AAR57325 Antimicrobial protein producing endo-symbiotic microorganisms - is produced by combining nucleic acids encoding the protein with an endophyte, useful for protecting plant hosts from esp. fungal disease.

Disclosure; Page 31; 39pp; English.

Plant-derived antimicrobial proteins are expressed in endosymbiotic Clavibacter xyli subsp. cynodoniis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFPI from R. sativus. The full-length cDNA sequence of Rs-AFPI is given in AAQ70128. (Updated on 25-MAR-2003 to

WPI; 1997-332786/30. P-PSDB; AAW19280 Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent.

```
This cDNA sequence encodes an Rhapanus sativus (radish) antifungal protein (Re-AFPZ). Analogues of the homologous protein. Rs-AFPZ AAM19281), have also been produced (see AAM19282-92, AAM19394-98, AAM19301-04, AAM19330-34 and AAM31765-834). Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease resistance or disease tolerance of crops, either pre or post harvest. When applied to plants they may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorganism capable of expressing the peptide into the soil. (Updated on 25-MAR-2003 to correct plied).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     106 AAGTIGIGGAAAAGGCCAAGIGGGACAIGGICAGGAGICIGIGGAAACAAIAACGCAIGC 165

                                                                                                                                                                                                                               This cDNA clone codes for the preprotein for radish antifungal protein 1 (Rs-AFP1) (AAW19617). Novel antifungal proteins are based on Rs-AFP1, Rs-AFP2 (see AAW19616), Rs-AFP3 and Rs-AFP4, especially those in which Gly9 is repaced by Arg, Val39 by Arg, Gly9 by Arg, Glus by Met and/or Gly16 by Met. Mutants (see AAW26371-90) of Rs-AFP2 are specifically claimed. The mutants show improved salt tolerant antifungal activity, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           40

Patent No. 6653280

GENERAL INFORMATION:
Patent No. 6653280

GENERAL INFORMATION:
APPLICANT: Liang, Jihong
APPLICANT: Shah, Dilip M.
APPLICANT: Rescherger, Cindy A.
APPLICANT: Rescherger, Cindy A.
TITLE OF INVENTION: Plant Pathogenic Fungi
TITLE OF INVENTION: Plant Pathogenic Fungi
TITLE OF INVENTION: Plant Pathogenic Fungi
CURRENT FILING DATE: 2001-04-09

FRIOR APPLICATION NUMBER: 09/103,489

FRIOR APPLICATION NUMBER: 09/103,489

FRIOR APPLICATION NUMBER: 09/103,489

FRIOR PILING DATE: 1998-06-24

NUMBER OF SEQ ID NOS: 20
SOFTWARE PatentIn Version 3.1

Patent No. 6215048
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Liang, Jihong
APPLICANT: Shah, Dilip M.
APPLICANT: Rw, Yonnie S.
TITLE OF INVENTION: Antifungal Polypeptide and Methods for TITLE OF INVENTION: Controlling Plant Pathogenic Fungi NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSEE: Charles E. Cohen, Monsanto Company, BB4F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADDRESSEE: Charles E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CGACATGGATCTTGCAACTATGTCTTCCCAGCTCACAAGTGTATCTGCTACTTTCCTTGT 255
                                                                             This sequence is antifungal protein Rs-AFP1 from Raphanus sativus. The exact source and isolation of the encoding DNA sequence is unclear from the specification. The protein is useful for combating fungi or bacteria eg gram positive bacteria and plant pathogenic fungii. It has moderate sensitivity to ions and an apparent low toxicity for cultured human cells. Plants transformed with the encoding DNA show increased disease resistance. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                          1 PheGlualaProThrMetValGluAlaGlnLysLeuCysGluArgProSerGlyThrTrp 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        41 SerGlyValCysGlyAsnAsnAsnAlaCysLysAsnGlnCys1leAsnLeuGluLysAla 60
Biocidal proteins isolated from seeds of plants - e.g. brassica or dahlia, useful for increasing plants' resistance to fungal and bacterial

                                                               plant-derived antimicrobial proteins are expressed in endosymbiotic clavibacter xyli subsp. cynodontis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFPI from R. sativus. The full-length cDNA sequence of Rs-AFPI is given in AAQ70128, and the amino acid sequence predicted from this sequence in AAR57325. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          84XXX
                                                                                                                            Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent.
                                                                                                                                                                                                      This protein sequence is a Raphanus sativus (radish) antifungal protein also been produced (see AAM12282-92, AAM19294-98, AAM19201-04, AAW19330-34 and AAW31765-83). Plants containing DMs sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease resistance or disease tolerance of crops, either pre or post harvest. Festsance or disease tolerance of crops, either pre or post harvest. When applied to plants they may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorganism capable of expressing the peptide into the soil. (Updated on 25-MAR-2003 to correct Plifield.)

This polypeptide comrpsies the preprotein for radish antifungal protein I (Rs-APP1). Novel antifungal proteins are based on Rs-AFP1, Rs-AFP2 (see AAM19466), Rs-APP3 and Rs-AFP4, especially those in which Gly9 is repaced by Arg, Val39 by Arg, Gly9 by Arg, Glu5 by Met and/or Gly16 by Met. Mutants (see AAW26371-90) of Rs-AFP2 are specifically claimed. The mutants show improved salt tolerant antifungal activity, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  135
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         195

                                                                                                                                                                                                                                                                                                                                                                                                 Biocidal proteins isolated from seeds of plants - e.g. brassica or dahlia, useful for increasing plants' resistance to fungal and bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is part of antifungal protein Rs-AFP2, decoded from a mutaganised RsAFP1 clone derived from Raphanus sativus. The protein is useful for combating fungi or bacteria eg gram positive bacteria and plant pathogenic fungii. It has moderate sensitivity to ions and an apparent low roxicity for cultured human cells. Plants transformed with the encoding DNA show increased disease resistance. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MetAlaLysPheAlaSerIleIleAlaLeuLeuPheAlaAlaLeuValLeuPheAlaAla

Antimicrobial, Rs-AFP2; symbiosis; disease-resistance; fungus-resistance;
Clavibacter xyli subsp. cynodontis; Cxc; crop improvement; endophyte;
PCR; polymerase chain reaction; mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Plant-derived antimicrobial proteins are expressed in endosymbiotic Clavibacter xyli subsp. cynodontis (CxC). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFP1 from R. sativus. The full-length cDNA sequence of PCK assisted site-directed mutagenesis of Rs-AFP2 is given in AAA70133 and the deduced amino acid sequence in AAR57127. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to disease caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present amino acid sequence represents a Brassica defensin protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          75

Novel protein from Brassica campestris, useful as antimicrobial against plant pathogenic filamentous fungi or pathogenic bacteria, especially for treating e.g. rice white leaf blight and sheath blight disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to disease retained by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, such as: rice white leaf blight, brownstripe diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present amino acid sequence represents a Brassica defensin protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               76 TTCGAAGCACCAACAATGGTGGAAGCACAGAAGTTGTGCGAAAAGGCCAAGTGGGACATGG

The present sequence represents a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein (AMP) 1 and the antifungal protein 2 (RSAPP2), linked by a linker propeptide of the invention. The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is posttranslationally processed into the component protein molecules. The propeptide sequence is rich in amino acids A, v. S and T and contains dipeptidic sequences consisting of either two acidic, two basic or one acidic and one basic residue as a cleavable linker sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           76 TTCGAAGCACCAACAATGGTGGAAGCACAGAAGTTGTGCGAAAGGCCAAGTGGGAACATGG 135

                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to sunflower anti-pathogenic proteins such as pathogenesis-related protein-5 (PR5), defensin and berberine bridge enzyme (BBE). DNA constructs containing nucleotide sequences encoding the anti-pathogenic proteins are useful for increasing resistance against pathogens e.g. fungal pathogen in moncot or dicot plants. The purified sunflower proteins (PR5, defensin or BBE) and compositions containing the proteins are useful for controlling plant pathogen by using procedures of spraying, dusting, scattering or seed coating, to the plants or the proteins are useful for controlling plant pathogen by using procedures of spraying, dusting, scattering or seed coating, to the plants or the proving are useful as genetic markers in disease resistance breeding programs. Promoters capable of driving expression of the proteins are useful as grenting proteins and insert resistance genes. The proteins can also be used in agricultural and pharmaceutical compositions as antifungal and antimicrobial agents. The nucleotide sequences encoding and for enhancing plant defense mechanism. The present sequence conservance represents a radish antifungal defensin (Swiss-Prot Accn No. P30230),
                                                                                                                       255

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents an Arabidopsis PDF1.2 gene which is used in a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensing gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fungi and does not require cytotoxic or potentially harmful chemicals

                                                                                                                                                                                                                                                                  .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a disease-resistant plant in which a wasabi gamma-thionin gene is introduced. Also described is a method for the creation of the above disease-resistant plant by introducing a wasabi gamma-thionin gene to a plant. The present sequence represents a Butrema wasabi (Wasabia japonica) gamma-thionin protein from the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the Arabidopsis PDF1.2 protein which is used in a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensin gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fungi and does not require cytotoxic or potentially harmful chemicals

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 49, Sequence 20, Sequence 20, Sequence 20, Sequence 59, Sequence 59, Sequence 21, Sequence 13, Sequence 15, Seque

Sequence 20, Application US/09103489

Patent No. 6215648

GENERAL INFORMATION:

APPLICANT: Liang, Jihong

APPLICANT: Mah, Yonnie S.

APPLICANT: Rosenberger. Cindy A.

TITLE OF INVENTION: Antifungal Polypeptide and Methods for TITLE OF INVENTION: Controlling Plant Pathogenic Fungi

NUMBER OF SEQUENCES: 20

CORRESPONDENCE ADDRESS:

ADDRESSES: Charles E. Cohen, Monsanto Company, BB4F

STREET: 100 Chesterfield Village Parkway No. 6215048th

CITY: St. Louis

STARES: Missouri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SOFTWARE: Petentin Release #1.0, Version #1.30 CURRENT APPLICATION DATA: APPLICATION NUMBER: US/09/103,489 FILING DATE: 24-UUN-1998 CLASSIFICATION: 800 ATTORNEY/AGENT INFORMATION: NAME: CLASSIFICATION UNMERE: 34,565 RECERRENCE/DOCKET NUMBER: 34,565 REFERENCE/DOCKET NUMBER: 34,565 TELECOMMUNICATION INFORMATION: TELECOMMUNICATION INFORMATION: TELEFAX: (314) 537-6224 TELEFAX: (314) 537-6224
